

METHODS AND APPARATUS FOR IMPLEMENTING A CRYPTOGRAPHY ENGINE

Abstract of the Disclosure

5 Methods and apparatus are provided for implementing a cryptography engine
for cryptography processing. A variety of techniques are described. A cryptography
engine such as a DES engine can be decoupled from surrounding logic by using
asynchronous buffers. Bit-sliced design can be implemented by moving expansion
and permutation logic out of the timing critical data path. An XOR function can be
10 decomposed into functions that can be implemented more efficiently. A two-level
multiplexer can be used to preserve a clock cycle during cryptography processing.
Key scheduling can be pipelined to allow efficient round key generation.
